

Flex Grow in CSS

Overview

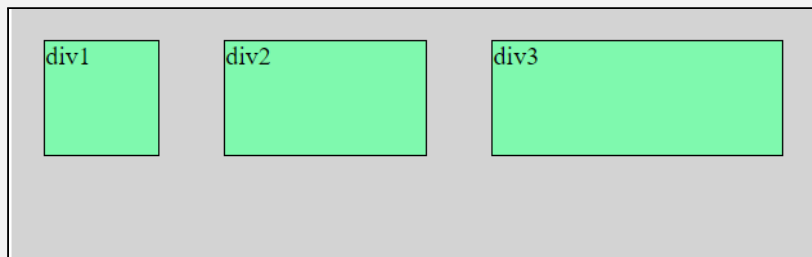

The flex-grow property specifies the ratio with which a **flex item grows relative to the other flex items** when there is some extra space available. This controls the extent how much a flex-item grows, with respect to other flex items.

This takes up any value from **0(zero) to any positive number**.

0(zero) means that the flex items' width would not change.

Example :

```
<div class="flex-container">
  <div style="flex-grow: 0 ;">div1</div>
  <div style="flex-grow: 2 ;">div2</div>
  <div style="flex-grow: 3 ;">div3</div>
</div>
```

Browser :

- ❖ Here, only the div2 and div3 grows, when the width of the container is increased. Also, div3 increases twice as much as div2. Now, width of div1 is 70px, div2 is 120px and div3 is 170px.
